12. ECOLOGICAL INFORMATION

12.1 Toxicity

Ezetimibe's production and use as an antilipemic may result in its release to the environment through various waste streams. If released to air, an estimated vapor pressure of 1.5×10^{-14} mm Hg at 25 °C indicates ezetimibe will exist solely in the particulate phase in the atmosphere. Particulate-phase ezetimibe will be removed from the atmosphere by wet or dry deposition. Ezetimibe does not contain chromophores that absorb at wavelengths >290 nm and therefore is not expected to be susceptible to direct photolysis by sunlight. If released to soil, ezetimibe is expected to be immobile based upon an estimated Koc of 8.9×10^4 . The estimated pKa of ezetimibe is 9.7, indicating that this compound will partially exist in the anion form in the environment and anions generally do not adsorb more strongly to soils containing organic carbon and clay than their neutral counterparts. Volatilization from moist soil surfaces is not expected to be an important fate process based upon an estimated Henry's Law constant of 4.4×10^{-18} atm-cu m/mole. Ezetimibe may not volatilize from dry soil surfaces based upon its vapor pressure. Biodegradation data were not available. If released into water, ezetimibe is expected to adsorb to suspended solids and sediment based upon the estimated Koc. Volatilization from water surfaces is not expected to be an important fate process based upon this compound's estimated Henry's Law constant. An estimated BCF of 100 suggests the potential for bioconcentration in aq

12.2 Persistence and degradability

No data available.

12.3 Bioaccumulative potential

Log P (n-octanol/water): 4

Potential for bioaccumulation exists (Log P > 3).

12.4 Mobility in soil

No data available.

12.5 Results of PBT and vPvB assessment

PBT/vPvB assessment not available.

12.6 Other adverse effects

This substance is classified as hazardous to the aquatic environment.
